sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Mouth:

Mechanical Digestion: The large pieces of food that are ingested have to be broken into smaller particles that can be acted upon by various enzymes. This is mechanical digestion, which begins in the mouth with chewing or mastication and continues with churning and mixing actions in the stomach.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Mouth:

Chemical Digestion: The complex molecules of carbohydrates, proteins, and fats are transformed by chemical digestion into smaller molecules that can be absorbed and utilized by the cells. Chemical digestion, through a process called hydrolysis, uses water and digestive enzymes to break down the complex molecules. Digestive enzymes speed up the hydrolysis process, which is otherwise very slow.

Nutrition for sport, exercise & health

Option D
Nutrition for

sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- **Esophagus:** Is sometimes known as the **gullet**, is an organ in vertebrates which consists of a muscular tube through which food passes from the pharynx to the stomach. In humans the esophagus is continuous with the laryngeal part of the pharynx at the level of the C6 vertebra. It is usually 25-30 cm long which connects the mouth to the stomach. It is divided into cervical, thoracic, and abdominal parts. The trachea branches off the esophagus to the lungs.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

Food is passed through the esophagus by using the process of peristalsis. Specifically, it connects the pharynx, which is the body cavity that is common to the digestive factory and respiratory system with the stomach, where the second stage of digestion is initiated.

The esophagus is lined with mucous membrane, and is more deeply lined with muscle that acts with peristaltic action to move swallowed food down to the stomach. The swallowing sound that we hear is the esophagus functioning.

Nutrition for sport, exercise & health

Option D

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Stomach:

The stomach is the expanded part of the digestive tract into which the esophagus opens. The empty stomach has a number of folds or ridges, called **rugae**, formed by the submucosa and mucosa, which serve to accommodate the filling and expanding of the stomach. Rugae are more prominent in the lower, narrow region of the stomach. The mixing and partial digestion of food by the stomach's gastric sections produces a pulpy fluid mix called chyme.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Stomach:
From the esophagus to the anus, the wall of the digestive tract has the same basic plan. From the **lumen** (inner space) outward four layers can be distinguished: the mucosa, submucosa, muscularis, and an outer connective covering, the adventitia.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Stomach:

The mucosa (also called mucous membrane) is the lining of the digestive tract. It consists of epithelial tissue resting upon a layer of connective tissue. At the base of the mucosa lies a very thin layer of smooth muscle.

The epithelial tissue provides a role in protection, secretion of mucous or digestive juices, or absorption of nutrients.

Nutrition for sport, exercise & health

Option D

sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Small Intestine:
The velvety appearance of the intestinal lining is due to millions of tiny finger like projections of the mucous membrane known as the **villi**. These villi increase the surface area of the small intestine for digestion and absorption of nutrients. The intestinal surface is further expanded by thousands of **microvilli**.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Large Intestine:
The functions of the large intestine may be summarised as follows:
 1. Absorption of sodium and water. Sodium is absorbed by active transport and water follows by osmosis.
 2. Incubation of bacteria. Because the movements are slow, bacteria have time to grow and reproduce. Some types produce certain vitamins (vitamin K, thiamine, folic acid, riboflavin and vitamin B12)

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Pancreas: The pancreas secretes pancreatic juice, which is an alkaline fluid containing a number of digestive enzymes.
These are produced in the pancreas and include specialised enzymes for the digestion and breakdown of proteins, fats and carbohydrates.

Solomon & Davis (1987)

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.1 Outline the principal components of the digestive system

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Liver: One of the chief functions of the liver is the production and secretion of bile, which is important in the digestion of fats.

Solomon & Davis (1987)

Nutrition for sport, exercise & health

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.3 Describe the function of enzymes in the context of macronutrient digestion.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- As previously stated, the pancreas produces enzymes which are specific in the breakdown of the macronutrients (carbohydrates, lipids and proteins).
- Enzymes play a role as a catalyst.
Catalysis is the process by which the rate of a chemical reaction (or biological process) is increased by means of the addition of a species known as a **catalyst** to the reaction.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.3 Describe the function of enzymes in the context of macronutrient digestion.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- A catalyst works by providing an alternative reaction pathway to the reaction product. The rate of the reaction is increased as this alternative route has a lower activation energy than the reaction route not mediated by the catalyst. The lower the activation energy, the faster the rate of the reaction.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.1.3 Describe the function of enzymes in the context of macronutrient digestion.

Sub-topics

**D.1 Digestion &
absorption**

**D. 2 Water &
electrolyte
balance**

**D.3 Energy
balance & body
composition**

**D.4 Nutritional
Strategies**

- Catalysts are proteins themselves and their activity is highest under optimum conditions of temperature and pH.
- This environment is provided by the digestive tract.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.4 Explain the need for enzymes in digestion.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- **Digestive enzymes** are enzymes in the alimentary canal that break down food so that the organism can absorb it. The main sites of action are the oral cavity, the stomach, the duodenum and the jejunum. They are secreted by different glands: the salivary glands, the glands in the stomach, the pancreas, and the glands in the small intestines.
- They are able to increase the rate of digestion whilst maintaining a stable body temperature.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.5 List the enzymes that are responsible for the digestion of carbohydrates, fats and proteins from the mouth to the small intestine.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- **Carbohydrates:**
 - Salivary amylase (oral cavity)
 - Pancreatic amylase (small intestine)
- **Fats:**
 - Pancreatic amylase (small intestine)
 - Pancreatic lipase (small intestine)
 - Bile (small intestine)
- **Protein**
 - Pepsin (stomach)
 - Trypsin (small intestine)

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Absorption of nutrients across the intestinal walls occurs either by **active transport** or by simple **diffusion**.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- **Active transport** is an energy-requiring process that moves material across a cell membrane and up the concentration gradient. The cell uses active transport in three situations: when a particle is going from low to high concentration, when particles need help entering the membrane because they are selectively impermeable, and when very large particles enter and exit the cell.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- **Diffusion** is the movement of substances across a membrane along, rather than against, an electrochemical gradient.
- Simple diffusion does not require does not require transport proteins or energy in the form of ATP.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Glucose, fatty acids and amino acids cross the brush-border membrane. This is a highly specialized mucosa of the small intestine that is responsible for the absorption of many nutrients.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- During this process nutrients pass through the cytosol (internal fluid of the cell) of the absorptive cell then cross the basolateral membrane (part of the plasma membrane) before entering the capillary network.
- Note: the plasma membrane is a selectively permeable lipid bilayer found in all cells.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Absorption of Carbohydrates
 - Glucose is absorbed by carrier-mediated transport process (Active Transport i.e. requires energy).
 - Each day a large amount of sodium is secreted into the intestine. If it were not continually reabsorbed we would be depleted of sodium in a few hours.
 - With the help of enzymes and energy, sodium is transported through the epithelial cells and into the blood. It is believed that glucose absorption follows this same transport system.
 - Glucose then enters the capillary system, eventually circulating into the hepatic portal vein which will transport them to the liver.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Absorption of Amino Acids
 - Are absorbed by active transport in the small intestine, in much the same way as glucose molecules except that there are four different transport systems, one for each chemical class of amino acids.
 - Amino acid transport in all four systems requires energy and is coupled to the transport of sodium.
 - They cross into the capillary system and like glucose are delivered to the liver via the hepatic portal vein.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.1.6 Describe the absorption of glucose, amino acids and fatty acids from the intestinal lumen to the capillary network.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

- Absorption of Fatty Acids
 - The absorption of fatty acids through the epithelial membranes is by diffusion. This is a far more efficient process than that of active transport.
 - The diffusion, following re-esterification, then takes place into the aqueous environment of the lymph and blood plasma.
 - In the presence of bile salts fat absorption is almost complete at 97%.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.2.1 State the reasons why humans can not live without water for a prolonged period of time.

Sub-topics

**D.1 Digestion &
absorption**

**D. 2 Water &
electrolyte
balance**

**D.3 Energy
balance & body
composition**

**D.4 Nutritional
Strategies**

- **Water:**
 - Is the basic substance for all metabolic processes in the body.
 - Regulates body temperature.
 - Enables transport of substances essential for growth.
 - Allows for the exchange of nutrients and metabolic end products.

Nutrition for sport, exercise & health

Option D

sport, exercise
and health

D.2.4 Annotate a diagram of a glomerulus and associated nephron.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

A **nephron** is the basic structural and functional unit of the kidney. Its chief function is to regulate the concentration of water and soluble substances like sodium salts by filtering the blood, reabsorbing what is needed and excreting the rest as urine. A nephron eliminates wastes from the body, regulates blood volume and pressure, controls levels of electrolytes and metabolites, and regulates blood pH.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.2.4 Annotate a diagram of a glomerulus and associated nephron.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

The glomerulus is a capillary tuft that receives its blood supply from an afferent arteriole of the renal circulation. The glomerular blood pressure provides the driving force for water and solutes to be filtered out of the blood and into the space made by Bowman's capsule.

Nutrition for sport, exercise & health

Option D

D.3 Energy balance & body composition

D.4 Nutritional Strategies

Illness, previously consumed food and beverages, environmental temperature, and stress levels can affect one's overall energy expenditure, and can affect one's BMR.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.3.1 Define the term basal metabolic rate (BMR)

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

BMR is measured under very restrictive circumstances when a person is awake, but at complete rest. An accurate BMR measurement requires that the person's sympathetic nervous system not be stimulated. A more common and closely related measurement, used under less strict conditions, is resting metabolic rate (RMR).

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.3.1 Define the term basal metabolic rate (BMR)

BMR and RMR are measured by gas analysis through either direct or indirect calorimetry, though a rough estimation can be acquired through an equation using age, sex, height, and weight.

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.3.1 Define the term basal metabolic rate (BMR)

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

Studies of energy metabolism using both methods provide convincing evidence for the validity of the respiratory quotient (R.Q.), which measures the inherent composition and utilization of carbohydrates, fats and proteins as they are converted to energy substrate units that can be used by the body as energy.

Nutrition for sport, exercise & health

Option D
Nutrition for
sport, exercise
and health

D.3.2 State the components of daily energy expenditure

Sub-topics

D.1 Digestion & absorption

D. 2 Water & electrolyte balance

D.3 Energy balance & body composition

D.4 Nutritional Strategies

The components of daily expenditure are:

- Basal Metabolic Rate
- Thermic effect of physical activity: energy expenditure above the resting metabolic rate (RMR) to allow for physical activity.
- Thermic effect of feeding: the increment in energy expenditure above RMR due to the cost of processing food for storage and use.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.3.3 Explain the relationship between energy expenditure and intake.

Sub-topics

**D.1 Digestion &
absorption**

**D. 2 Water &
electrolyte
balance**

**D.3 Energy
balance & body
composition**

**D.4 Nutritional
Strategies**

Research Task: Explain the relationship between energy expenditure and intake.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.3.3 Explain the relationship between energy expenditure and intake.

Sub-topics

**D.1 Digestion &
absorption**

**D. 2 Water &
electrolyte
balance**

**D.3 Energy
balance & body
composition**

**D.4 Nutritional
Strategies**

Research Task: Explain the relationship between energy expenditure and intake.

Nutrition for sport, exercise & health

Option D
**Nutrition for
sport, exercise
and health**

D.3.4 Discuss the association between body composition and athletic performance.

Sub-topics

**D.1 Digestion &
absorption**

**D. 2 Water &
electrolyte
balance**

**D.3 Energy
balance & body
composition**

**D.4 Nutritional
Strategies**

Research Task: Explain the relationship between energy expenditure and intake.

Consider body composition from two components, fat and fat free mass. A distinction between fat free mass and lean body mass should be made. The discussion should include reference to typical levels of fat and consider the accuracy of body fat measurements.
